Project Description

We provide structural engineering services for the TGI Fridays national chain of restaurants, including structural advice for re-fitouts, internal refurbishments and restaurant extensions.

Within this framework we provide professional advice from initial site acquisitions through detailed design and construction.

Key Facts

Booth King's role in the project was to provide all civil and structural engineering for the Client. There have been some unusual problems to overcome along the way. At the Manchester St Anne's Square restaurant the structure had to be designed so that the existing kitchen extractor duct had to pop out of the top of the clock tower above!
